

► Research as a Competition

Team Power Rangers

► Main Goal of the platform

Serve as a **translation platform** between the world of research and business.

Enable efficient matching between companies and research teams based on their domains of expertise

Translate company-defined business objectives into structured research questions using AI-driven algorithms.

Facilitate continuous communication via the platform environment to ensure that both parties understand each other

► 3 pillars of the platform

01

Project Posting (For businesses)

02

Project Application (For research teams)

03

Communication and Alignment environment (Connects both)

► Project Posting

The company inputs a raw business plan. They write a clear end-goal of the project (product, platform, market analysis).

The idea is then translated (By an AI model) into a set of Research Questions that should be solved. Those are then posted on the platform where research teams compete for them.

► Application Process

The application is submitted by a research team.

The platform extracts the previous publications of each member creating a profile.

Companies can evaluate the candidate teams by looking at their profiles and determining if their research domain aligns with company goals.

► Communication and Alignment Environment

Research team uploads weekly reports linking results to predefined research questions.

Platform translates the report into an interactive progress dashboard linking it to key KPIs and company metrics.

This allows the companies to track the progress of the research without going into technical depth but rather focusing on business alignment.
